Ida Gasoline Company

Assessment of potential for Superfund Removal Action

A site assessment to determine the potential for performing a Superfund Removal Action at the Ida Gasoline Company was conducted on March 24, 1987. Soil samples were collected from drainage courses leading to an intermittent stream that bordered the site. These samples did not indicate significant offsite migration of CERCLA designated hazardous materials from the site. The site was remotely located and the potential for human contact appeared to be very low.

In an on-site meeting with Mr. John Halk, of the Louisiana Department of Environmental Quality, it was learned that a steering committee representing the potentially responsible parties was being formed, and that the state would negotiate with the steering committee to perform site remedial actions.

Since the site did not appear to pose a significant threat to human health or the environment, and the State was making progress towards accomplishing a PRP funded cleanup, it was determined that a Superfund Removal Action was not warranted at that time.
